

Nath S. K., Thingbaijam K. K. S., Ghosh S. K. (2010). Earthquake Catalogue of South Asia - a Generic M_w Scale Framework

The catalogue is prepared with sixteen columns as described below:

1. The first three columns represent the date: YEAR, MONTH, DAY
2. Origin Time (in UTC) is given in the next three columns: HH, MM, SS
3. The epicentral coordinate is given in next two columns: LAT, LON
4. Focal depth and associated error (standard deviation) are listed under columns: DEPTH, D_ERR
5. The next three columns present the native magnitude type, its value and associated error: NM_TYPE, NMAG, NM_ERR
6. The next two columns list the equivalent moment magnitude, and its associated error: MW, MW_ERR
7. The next column is provided for the native data source: SOURCE
8. The last column is provided to indicate the likely type of shock: SHOCK

In case of non-availability of particular field value, the value of '-1' is inserted in the catalogue.

The codes assigned to the different sources are as given below:

Caveat on the pre-instrumental catalogue:

The data on the historical earthquake has several shortcomings: (1) inhomogeneity cannot be ruled out; magnitude scale (M_w) may not be the same across different studies; (2) deemed highly incomplete as well having large uncertainties; and (3) appropriate treatment on the associated uncertainties and incompleteness is required.
